JOB TITLE: GenAI Developer
POSITION TITLE:
DEPARTMENT: Business Technology Systems group (BTS)
JOB CODE:
GRADE:

PRIMARY FUNCTION:

The Generative AI Developer designs, builds, and operates production-grade generative AI applications and agentic workflows that improve productivity, automate repeatable work, and accelerate decision-making. This role blends full-stack engineering with LLM integration and agent orchestration, including hands-on development using Anthropic Claude/Claude Code, prompt engineering, Model Context Protocol (MCP) integrations, and agent-to-agent (A2A) protocol patterns for multi-agent collaboration. The developer partners closely with product owners, architects, security, and business stakeholders to deliver secure, scalable solutions that integrate with enterprise systems while maintaining strong governance, observability, and reliability.

SCOPE OF RESPONSIBILITY

- **Individual Contributor** role with significant cross-functional influence
 - **Complexity:** High — ambiguous problems, rapid iteration, and production hardening.
-

SPECIFIC DUTIES / ACCOUNTABILITIES (in order of importance)

1) GenAI Product Development (Full-Stack)

- Build **end-to-end GenAI applications** that support real business workflows.
- Implement conversational experiences (chat), task-driven experiences (forms/flows), and embedded copilots inside internal tools.
- Deliver clean, maintainable code with strong testing discipline, code reviews, and documentation.

2) LLM Integration & Prompt Engineering

- Integrate LLMs into applications with patterns such as **tool/function calling**, **structured outputs**, and **retrieval-augmented generation (RAG)** where appropriate.
- Design and maintain **prompt libraries**, reusable system prompts, and guardrails that produce consistent outcomes.
- Establish quality gates: test prompts and model changes for reliability, safety, and regressions.

3) Agents & Agentic AI Architecture

- Design and implement **agentic systems** (planner/executor, tool-using agents, multi-step workflows) that can execute tasks with human oversight.
- Build multi-agent collaboration patterns, including **agent routing**, delegation, memory/context management, and failure recovery.
- Apply **A2A protocol concepts** for agent-to-agent handoffs and interop (where multi-agent services are used).

4) MCP (Model Context Protocol) Integrations

- Build or integrate **MCP servers/clients** to connect agents to enterprise tools and data sources in a standard, governed way.
- Implement capability boundaries, access controls, and least-privilege tool exposure to agents.

5) Platform Readiness: DevOps, Observability, and Reliability

- Package and deploy services using modern CI/CD practices.
- Implement logging, tracing, monitoring, and alerting for AI workflows (including prompt/version telemetry and model behavior monitoring).
- Tune performance and cost: caching, batching, token budgeting, timeouts, and graceful degradation.

BASIC QUALIFICATIONS

Education

- Bachelor's degree in Computer Science, Engineering, or equivalent practical experience.
- 8+ years software engineering (full-stack) with 2–4+ years GenAI/LLM systems delivery
- Strong full-stack skills in common enterprise stacks (e.g., **TypeScript/JavaScript + Node, Python, .NET/Java**), plus modern frontend frameworks.
- Hands-on experience with **LLM application patterns** (tool calling, RAG, embeddings, structured outputs).
- Experience building APIs and services with strong testing, security, and performance practices.
- Familiarity with **agentic workflows** and multi-step automation patterns.
- Working knowledge of **AWS/Azure** (or equivalent agentic coding tools) in real development workflows.
- Familiarity integrating or designing around **MCP** and/or standardized tool-connection protocols.
- Familiarity with **A2A protocol concepts** (agent capability discovery, handoff, task lifecycle, and interop patterns).

ADDITIONAL / PREFERRED QUALIFICATIONS

- Experience with evaluation approaches for LLM apps (offline tests, golden sets, regression suites, human review loops).
- Experience with vector databases / search systems and retrieval pipelines.
- Experience with cloud-native delivery (containers, serverless, API gateways, secrets management).
- Experience implementing safety controls: prompt injection resistance, data-loss prevention patterns, output filtering, and permissioned tool access.
- Strong communication skills: translate business outcomes into engineering design and measurable results.
- Experience working in enterprise governance environments with security and compliance stakeholders.
